Further information

* All vehicles are tested according to WLTP technical procedures. Figures shown are for comparability purposes; only compare fuel consumption, CO₂ and equivalent electric range figures with other vehicles tested to the same technical procedures. These figures may not reflect real life driving results, which will depend upon a number of factors including the accessories fitted (post-registration), variations in weather, driving styles, vehicle load (and, for battery electric vehicles, the starting charge of the battery).

Figures for plug-in hybrid vehicles were obtained using a combination of battery power and fuel. Plug-in hybrid vehicles require mains electricity for charging.

Figures for battery electric vehicles were obtained after the battery had been fully charged. Battery electric vehicles require mains electricity for charging. Zero emissions while driving.

Figures quoted are subject to change due to ongoing approvals/changes and range figures may include options not available in the UK. Please consult your local Audi Centre for further information.

Data correct at 1st April 2021.

**For Q4 e-tron and Q4 Sportback e-tron 50 quattro - Maximum power determined in accordance with UN GTR.21; up to 25 kW of this is accounted for by the overboost, which can be called up for max. 30 seconds. The power output available in individual driving situations depends on variable factors such as ambient temperature, charging/temperature/conditioning status or physical ageing of the high-voltage battery. In particular, for the maximum power (overboost) to be available a high-voltage battery temperature between 23 and 50°C and a battery charge level > 88% are required. Any deviations from the parameters specified above in particular can lead to reduced power output and even to the overboost not being available at all. To a certain extent, the battery temperature can be indirectly influenced via the auxiliary air conditioning function and the charge level and other parameters can be set in the vehicle. The power output currently available is displayed on the vehicle's power meter. To maintain the high-voltage battery's usable capacity as far as possible, it is recommended to set a charging target of 80% for the battery for day-to-day use (can be adjusted to 100% e.g. before long journeys).

Recommended On - The - Road (OTR) retail prices include: delivery charge, half a tank of fuel, number plates, first registration fee at £55.00 and Vehicle Excise Duty.

Recommended On-The-Road (OTR) retail prices shown are based on the current 2021/2022 VED rates.

As outlined in the Chancellor of the Exchequer's 2015 budget, the way Vehicle Excise Duty (VED) is calculated will change from 1 April 2017 for the majority of vehicles. The first licence will continue to be calculated using the vehicle's CO₂ value, but subsequent licences will be based on a standard rate of £140. Vehicles with a list price exceeding £40,000 (including factory installed options, delivery charge, number plates and VAT) will pay an additional £310 plus the standard annual rate for a 5 year period. After the 5 year period only the standard rate will apply.
